

1. Create a new folder under C drive called Dumps
2. Open Registry Editor
3. Go to *HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\Windows Error Reporting\LocalDumps*
4. Right click on LocalDumps and select New> Key
5. Name the key as *<process_name>.exe*
6. Right click *<process_name>.exe* and select New> DWORD
7. Name it as *DumpType* and set the value as *00000002*
8. Right click *<process_name>.exe* and select New> DWORD
9. Name it as *DumpCount* and set the value as *0000000a*
10. Right click *<process_name>.exe* and select New> String Value
11. Name it as *DumpFolder* and set the value as *C:\Dumps*
12. If the Windows Error Reporting service is already started (the service name is WerSvc), you may need to stop/restart it, so the new registry configurations are read appropriately.
13. Perform the steps to reproduce the crash and once the issue happens, a crash dump should be created in the folder specified above.

Alternatively, we can also use

1. Open an elevated command prompt (i.e., with administrative privileges) and type the following commands:

```
reg add "HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\Windows Error Reporting\LocalDumps\<process_name.exe>" /v DumpFolder /t REG_EXPAND_SZ /d "C:\Dumps" /f
```

```
reg add "HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\Windows Error Reporting\LocalDumps\<process_name.exe>" /v DumpType /t REG_DWORD /d "2" /f
```

```
reg add "HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\Windows Error Reporting\LocalDumps\<process_name.exe>" /v DumpCount /t REG_DWORD /d "10" /f
```

2. Create a new folder under C drive called Dumps (or other folder you specified in the reg add command above) if the folder does not exist.
3. If the Windows Error Reporting service is already started (the service name is WerSvc), you may need to stop/restart it, so the new registry configurations are read appropriately.
4. Perform the steps to reproduce the crash and once the issue happens, a crash dump should be created in the folder specified above.

<Note for engineer>

This configuration for Windows Error Reporting would collect full memory dumps if the process specified would crash. It should be used when we are sure about the process name which is crashing.
