

1. Clear the Temporary Internet Files and close all the instances of Edge opened.
2. Open a fresh instance of Edge.
3. Press F12 key and F12 developer tools would appear on the screen.
4. Alternatively, we can also go to Settings> More Tools> Developer Tools to open F12 Developer Tools.
5. Once opened, go to the Network tab.
6. By default, it would be in Capturing mode. If it is Stop button would be enabled and the toolbar would look like this:

7. If it does not load in this mode, click on the Record button and it would start capturing.
8. Carry out the steps to reproduce the issue.
9. Once the issue is reproduced, click on the Stop button on the F12 Network tool.
10. Click on *Export HAR* button to save the capture.

11. File should be saved in .har extension.

### <Note for Engineer>

There is an option on F12 Network tool called *Preserve log* and it stays disabled by default. If we are capturing a log from a scenario where multiple redirections would happen, then we should always enable this option before capturing the log. Else, Network tool would clear the entries as soon as navigation happens.
