

1. Clear Temporary Internet Files from Edge and then close all the open instances of Edge.
2. Open a fresh instance of Edge and type `edge://net-export` in the address bar and hit Enter.

Capture Network Log

Start Logging to Disk

Click the button to start logging future network activity to a file on disk. The log includes details of network activity from all of Microsoft Edge, including InPrivate and non-InPrivate tabs, visited URLs, and information about the network configuration. [See the Chromium website for more detailed instructions.](#)

OPTIONS: This section should normally be left alone.

- ☒ Strip private information
- ☐ Include cookies and credentials
- ☐ Include raw bytes (will include cookies and credentials)
- Maximum log size (megabytes): (Blank means unlimited)

3. Select *Strip private information* option.
4. Click on *Start Logging to Disk* and it would present a dialog to save the file in which the trace would be captured.
5. Select the location where we want to save the file, name the file, and save it.
6. Open a new tab in the same window and reproduce the issue.
7. Once the issue has been reproduced, come back to the tab where net-export was running and click on *Stop Logging* button.

Saving network events to disk...

Stop Logging

Reproduce the network problem now using another tab. When you are done, return to this page and click the Stop button.
All of your browser's networking activity will be written to the log file until you either click the Stop button, or close this tab.

FILE: c:\[redacted]\Downloads\rwesr.json
OPTIONS: Strip private information

8. File would be saved at the location chosen in Step 5.

<Note for Engineer>

Generally, we should collect with *Strip private information* enabled on `edge://net-export`. However, it might change depending on the scenario. So, it is always advised to check with Escalations or Technical Advisors on which option should be chose unless we are very sure on which option should be used.
