

1. Close all the running applications as this tool would require little more space to run.
2. The exe name of this tool is TTTracer.exe and it is a debugger utility which attaches itself with the process to get the complete data. So, we would need to verify that there is no AntiVirus program which could block this utility from attaching itself with <process_name> process.
3. Once we have the above two conditions in place, download *PartnerTTDRecorder_x86_x64.zip* file from the workspace. I have uploaded it today. To be able to download from the workspace, we would need to Sign in on the workspace with the Microsoft account.
4. Extract the content and there are two versions of it, 64bit and 32bit. We would need to make use of the exe in accordance with the Operating System's bitness.
5. Run an instance of browser. Go to Task Manager and make a note of the Process ID.
6. Run Command Prompt as Administrator and go to the location where we have TTTracer.exe.
7. Once done, we would have to initialize the Tracer by running this command - *TTTracer.exe - initialize*
8. Run this command to attach the utility with the process – *TTTracer.exe -dumpFull -attach <PID>*. Replace the <PID> part of the command with the Process ID determined in Step 5.
9. You will see a small window with Exit App button on it and the name of the exe on the title. If you can see this, it means that the tracer has been successfully attached to the process.
10. Reproduce the issue on the opened browser window.
11. Uncheck the tracing option on the TTT window.
12. Go to the folder from where we have used TTTracer.exe and check if we get two files with the extension .out and .run.
13. If yes, upload them on the workspace.
14. If the issue does not happen in one attempt, then close TTTracer.exe and repeat the steps to collect the logs.

<Note for Engineer>

- There would be two files generated with .out and .run extension. We would need both the files.
- Process ID determination is very important while capturing TTT. So, make sure we have the right Process ID before attaching the debugger.
- The ready package of TTT could be obtained from [\\dbg\privates\latest\partner](#) location. We should use the zipped folder present by the name *PartnerTTDRecorder_x86_x64.zip*.
